NOTA DINAS
Nomor : ND- 567 /UN2.F1.D1.4/PPM.00.00/2024

Yth. : Para Peneliti FKUI
Dari : Manajer Riset dan Pengabdian Masyarakat
Perihal : Informasi Call for Proposal ISIS Neutron and Muon Source – Access for Indonesian Researchers

Berdasarkan surat dari Direktur Riset dan Pengembangan Universitas Indonesia Nomor: ND-65/UN2.RST/PPM.00.00/2024, bersama ini kami sampaikan ISIS Neutron and Muon Sources yang berlokasi di Science and Technology Facilities Council (STFC) Rutherford Appleton Laboratory, Oxfordshire, United Kingdom merupakan pusat penelitian sains dan teknologi dengan fokus pemanfaatan radiasi neutron dan muon untuk mempelajari material pada atomic level. Setiap tahunnya, ISIS menyediakan fasilitas dan instrumen penelitian kepada sekitar 3000 peneliti dari seluruh dunia dengan topik penelitian yang sangat beragam, termasuk di dalamnya arkeologi, biologi, geologi, fisika, kimia, katalis, riset energi terbarukan, dan teknik.

Bersama ini kami sampaikan bahwa ISIS memberikan kesempatan kepada para peneliti di Indonesia untuk mengajukan proposal sehingga peneliti dapat menggunakan fasilitas dan instrument – instrument yang ada di ISIS. Pengusulan proposal dapat dilakukan mulai tanggal 1 Maret 2024 – 17 April 2024. Informasi lebih lanjut dapat mengakses tautan www.isis.stfc.ac.uk/Pages/Malaysia-Indonesia.aspx. Terlampir kami sampaikan leaflet program tersebut.

Demikian informasi ini kami sampaikan, Atas perhatian dan kerjasama yang baik, kami ucapkan terima kasih.

ISIS Neutron and Muon Source
Access for Indonesian researchers
At ISIS, scientists use beams of neutrons and muons to study materials at the atomic level. The facility operates a suite of 35 experiment stations, each optimised to study different atomic and molecular properties of materials.

The neutron and muon beams at ISIS can be used to study a broad range of science areas, from fundamental physics, including magnetism and superconductivity, to chemistry and catalysis, polymers, biosciences, engineering, geology, and a wide range of advanced and applied materials.

Neutrons provide complementary information to that given by X-rays and other methods. Muons are a more unusual probe of materials, but give complementary information to neutrons, particularly in studies of magnetism, superconductivity and ionic conductivity.

Scan the QR code to view recent science highlights from ISIS.
Why use neutrons?

**STUDY DYNAMICS**
Neutron energies are comparable to the time scales of molecular diffusion, vibrations and rotations.

**STUDY STRUCTURE**
Neutron wavelengths are comparable to the spacings of atoms and molecules.

**PENETRATION POWER**
Neutrons can penetrate deep into matter (including many different metals) enabling the study of large samples - even within complex sample environments.

**STUDY MAGNETISM**
The neutron's magnetic moment can be used to study the microscopic magnetic properties of materials.

**NON-DESTRUCTIVE**
Neutrons are suitable for the characterisation of delicate and precious samples.

**VERSATILE SAMPLE ENVIRONMENTS**
Sophisticated sample environments enable studies under operating conditions, including extreme temperatures and pressures.

**SENSITIVITY TO LIGHT ELEMENTS**
The neutron scattering power of nuclei varies in a quasi-random manner such that lighter atoms (e.g. H, Li) can be studied in the presence of heavier ones.

**COMPLEMENTARITY**
Neutron scattering is highly complementary to other techniques, such as X-ray scattering, electron microscopy, magnetic resonance and computational methods.

**ISOTOPIC CONTRAST**
Neutrons are sensitive to different isotopes of the same element, so isotopic substitution (e.g. H/D) can be used to highlight specific features.
Case study: ISIS and Indonesia – for a climate friendly future

Dr Indri Adilina has worked with ISIS since 2018 to establish a viable method of using palm oil biomass waste to generate biofuel to reduce Indonesia’s reliance on fossil fuels.

With the support of dedicated scientific and technical teams at ISIS, Dr Adilina has used advanced techniques, such as INS (inelastic neutron scattering) and QENS (quasi-elastic neutron scattering) to harness the unique properties of neutrons. These studies have provided insight into the catalytic process involved in biofuel production and important information for catalyst design and optimisation.

“Using neutron science we are trying to master the technology of biomass catalysis and establish whether bentonite clay, a renewable and abundant resource in Indonesia, could provide as a suitable catalyst support for the conversion of palm oil wastes into biofuel.”

Dr Indri Adilina
Researcher for The National Research and Innovation Agency (BRIN) of the Republic of Indonesia
Using the ISIS Neutron and Muon Source

Researchers can apply to use ISIS instruments by submitting proposals to the facility and, if successful, facility time is normally scheduled within six months.

Researchers attend ISIS for their experiments and usually stay in on-site accommodation at the Rutherford Appleton Laboratory. Experiments typically last between 1-6 days and are assigned an ISIS scientist who provides advice on sample preparation, the practicalities of running the experiment and data analysis.

ISIS scientists can also offer support with proposals and advise on the best-suited instrument for a particular investigation.

Funding for Indonesian researchers

STFC (ISIS) has been awarded a grant from the UK’s International Science Partnerships Fund² to support Indonesian use of ISIS until March 2026. The award will pay for the costs of beamtime at ISIS, and will support the cost of travel, food and accommodation of Indonesian researchers coming to ISIS for experiments.

The fund will also provide workshops and webinars for technical advice on muon and neutron science, and can support costs for researchers to disseminate their research at ISIS once back in Indonesia.

² The International Science Partnerships Fund is a long-term approach to international research and collaboration for the UK, led by the Department for Science, Innovation and Technology.
